

## **A NEW CRIssoft PROJECT WITHIN VALROM**

*Sursa: Bucharest Business Week 19 Ianuarie 2004*

The most efficient use of bar codes within a warehouse is a business necessity for any modern organization that aims to a better stocks administration on physical locations and a maximum fluidisation of products' delivery and reception process for a minimum time spent for each of those processes.

Based on this business necessity was a new project developed including a new CRIssoft module - "CROS - Warehouse Administration System (bar codes and online mobile bar code readers)" for one of the most modern and ambitious organizations in Romania, VALROM Industrie ([www.valrom.ro](http://www.valrom.ro))

The maximum automatization of products administration flow, using bar codes scanning associated to the products during the whole process "the entrance in the warehouse" -> " optimal placement/movement on the shelf" -> "preparing and delivery to client"; the decrease number of internal documents and the remove of all manual steps (that don't use the integrated system; a more precise evaluation of the work volume for each employee and it's optimisation according to necessities, using the precise allocation of all tasks; all those are some of the objectives proposed by the new CRIssoft module.

Being now in an advanced testing state, CROS Module "CROS - Warehouse Administration System (bar codes and online mobile bar code readers)" may run independently or integrated with CROS ERP system ([www.crisoft.ro](http://www.crisoft.ro))
